

POST 10 - DATA GOVERNANCE
ADAPTATION FROM THE DATA GOVERNANCE INSTITUTE

DATA GOVERNANCE	GOVERNANCE FRAMEWORK	AREAS AND COMPONENTS
DATA GOVERNANCE - Is the system of decision rights and accountabilities that describes who can take what actions with what information, and when, under what circumstances, using what methods. • Data Governance programs with a focus on Data Warehouses / BI often start small, but may scale up to other efforts. <i>The idea is to 'act locally but think globally'.</i> Best practice - Consider receiving input from other organizations that have successfully launched Data Governance programs • What metrics did their executives want to see? What value statements resonated with their stakeholders? What funding models did they use, and were they successful? Governance vs Management - Management is about the decisions that you make. Governance is the structure for making them. (CIO Magazine) Communication challenge - At the industry’s first Data Governance Conference, in Orlando, Florida USA in December of 2006, leaders of successful Data Governance programs declared that, in their experience, Data Governance is between 80% and 95% communications! - Even today, communication remains one of the biggest challenge in implementing data governance programs. - It must be based on a statement of value that is understandable and shared by all stakeholders. - This statement must then be incorporated into a roadmap that demonstrates how the value will be delivered and measured.	Frameworks help us organize how we think and communicate about complicated or ambiguous concepts. If your organization employs a framework, your people can more easily achieve clarity of thought and purpose. 	SIX DATA GOVERNANCE FOCUS AREA - They all have activities that address a 3-part governance mission: <i>to create rules, resolve conflicts, and provide ongoing services.</i> - They all employ most or all of the universal components of a Data Governance program. - They all address universal governance processes and services, such as Issue Resolution and Stakeholder Care. 10 UNIVERSAL COMPONENTS OF A DATA GOVERNANCE PROGRAM Grouped into 3 categories - Group 1 : Rules and Rules of Engagement (components 1 to 6) - Group 2 : People and Organizational Bodies (components 7 to 9) - Group 3 : Processes (component 10) Components 1-6 deal with rules. - They also describe the “rules of engagement” employed by components 7-9 (People and Organizational Bodies) during governance. Data Governance does not always begin with the design of the program . - Before you start deciding who sits on what committee, you should be clear about your program’s value statement. - You should have developed a roadmap to share with stakeholders. - Stakeholders will want to know the WHO / WHAT / WHEN / WHERE / WHY / HOW of your program before they decide to support it, so you need to anticipate their questions. You will need preliminary answers, even if they are only assumptions until you complete the actual program design.
SIX FOCUS AREAS	TEN UNIVERSAL COMPONENTS	
1. Policy/ Standards/ Strategy: Governance policies, backed by cross-functional Stewards, can give the needed weight to architectural positions. - A charter may hold Data Governance and Stewardship participants accountable to: <i>Review, approve, monitor policy; Collect, choose, review, approve, monitor standards; Align sets of policies and standards; Contribute to Business Rules; Contribute to Data Strategies; Identify stakeholders and establish decision rights.</i> 2. Data Quality : Data Governance often sets direction for Data Quality and then monitors the success of Data Quality efforts. - A charter may hold Data Governance and Stewardship participants accountable to: <i>Set direction for Data Quality; Monitor Data Quality; Report status; Identify stakeholders, establish decision rights and clarify accountabilities.</i> 3. Privacy/ Compliance/ Security: Programs that focus on Privacy / Compliance / Security often stem from a management mandate. - A charter may hold Data Governance and Stewardship participants accountable to: <i>Help protect sensitive data through support for Access Management and Security requirements; Align frameworks and initiatives ; Help assess risk and define controls to manage risk; Help enforce regulatory, contractual, architectural compliance requirements; Identify stakeholders, establish decision rights and clarify accountabilities.</i> 4. Architecture/ Integration: A move to SOA, with its need for well governed data, could be a driver for a program with a focus on Arch. /Int. - A charter for this type of program may hold Data Governance and Stewardship participants accountable to: <i>Ensure consistent data definitions; Support architectural policies and standards; Support Metadata Programs, SOA, Master Data Management, Enterprise Data Management (EDM); Bring cross-functional attention to integration challenges; Identify stakeholders, establish decision rights and clarify accountabilities.</i> 5. Data Warehouse and BI: Data Governance programs with a focus on DW/BI often start small, but may scale to other efforts. The idea is to “act locally but think globally.” - A charter for this type of program may hold Data Governance and Stewardship participants accountable to: <i>Establish rules for data usage and data definitions; Identify stakeholders, establish decision rights, clarify accountabilities; Identify SDLC embedded governance steps and loop-outs for projects; Clarify the value of data assets and data-related projects.</i> 6. Management support: Data Governance programs with a focus on Management Support typically come into existence when managers find it difficult to make “routine” data-related management decisions because of their potential effect on operations or compliance efforts. - A charter for this type of program may hold Data Governance and Stewardship participants accountable to: <i>Measure the value of data and data-related efforts; Align frameworks and initiatives; Identify stakeholders, establish decision rights, clarify accountabilities; Identify SDLC embedded governance steps and loop-outs for projects; Monitor and report on data-related projects; Promote data-related messages and positions.</i>	1. Mission and Vision: At its highest level, Data Governance has a three-part mission: <i>Proactively define and align rules; Provide ongoing, boundary-spanning protection and services to data stakeholders; React to and resolve issues arising from non-compliance with rules.</i> 2. Goals, Metrics, Measures: <i>Some goals may result in “soft” results or hard to measure; Others should be SMART. Metrics should also be SMART.</i> 3. Data Rules and Definitions : Refers to data-related policies, standards, compliance requirements, business rules, and data definitions. <i>Depending on your focus areas, the program may work to: Create new rules and definitions; Gather existing rules and definitions; Address gaps and overlaps; Align and prioritize conflicting rules and definitions; Establish or formalize rules for when certain definitions apply.</i> 4. Decision Rights: Before any rule is created, a prior decision must be addressed: who gets to make the decision, when, and using what process? <i>It is the responsibility of the Data Governance program to facilitate the collection of decision rights that are the “metadata” of data-related decisions.</i> 5. Accountabilities: Who is responsible for the delivery, and when? <i>For activities that do not neatly map to departmental responsibilities, the Data Governance program may be expected to define accountabilities that can be built into everyday processes and the organization’s software development life cycle (SDLC).</i> 6. Control: How do we deal with risk? <i>They can be: Preventative, detective; corrective - manual, technology-aided, or completely automated.</i> <i>We manage it, preferably by preventing the events that we don’t want to occur. Those we can’t be sure of preventing, we at least detect, so we can then correct the problem. Organization’s risk management strategies are made operational through controls.</i> 7. Data Stakeholders: Include groups who create data, those who use data, and those who set rules and requirements for data. <i>Because Data Stakeholders affect and are affected by data-related decisions, they will have expectations that must be addressed.</i> <i>Consider implementing a Data Governance Board made up of executive level stakeholders.</i> 8. A Data Governance Office: It collects metrics and success measures and reports on them to data stakeholders. <i>It provides ongoing Stakeholder Care in the form of communication, access to information, record-keeping, and education/support</i> 9. Data Stewards: Is the set of activities that ensure data-related work is performed according to policies and practices. <i>The Data Stewardship Council consists of a number of Data Stakeholders who come together to make data-related decisions. They may set policy, specify standards, craft recommendations that are acted on by a higher-level Data Governance Board. May also include Data Quality Stewards.</i> 10. Ongoing Data Governance Processes: Every organization will decide how much structure and formality to bring to the process. The DGI recommends formal, documented, repeatable procedures for: <i>Aligning Policies, Requirements, and Controls; Establishing Decision Rights & Accountability; Performing Stewardship; Managing Change; Defining Data; Resolving Issues; Specifying Data Quality Requirements; Building Governance Into Technology; Stakeholder Care; Communications; Measuring and Reporting Value</i>
